valuable training aid and reference for pilots, instructors, and flight students, and the most authoritative book on instrument use anywhere.

This book fills a vital gap in the literature on air traffic control. It gives an insight into the UK ATC system, including systems and principles and airspace management, which also has a worldwide application. The most recent advances are discussed including application of secondary surveillance radar, application of automation, airborne threat alert and collision avoidance systems - Mode 'S' and Monopulse SSR. Arnold Field also examines the collaboration, for safety reasons and to ensure the most economic use of national resources, between civil and military authorities.

Straits Used for International Navigation

Instrument Flying Handbook (FAA-H-8083-15A)

Compendium of International Civil Aviation

After an introductory chapter concerning the definition of 'Straits used for international navigation', the author examines in detail the evolution of the question in the years prior to the convening of UNCLOS-III, during the preparatory works of the Sea-Bed Committee and throughout the Conference. The second part of the book studies the legal norms set up by the 1982 UN Convention on the Law of the Sea concerning the regime of transit passage for maritime and air navigation applicable in most of the straits used for international navigation and the regime of innocent passage residually applied in the other straits. In the final chapter, the author makes a critical appraisal of the new regimes of navigation and overflight in straits, exposes the implications of such regimes in Spain, analyzes the applicability of the Convention's regulations before their coming into force, and examines the practice followed in the last few years by the most important States which favoured or opposed the regime of

transit passage. From his position as Deputy-Head of the Spanish Delegation to the Law of the Sea Conference, Ambassador de Yturriaga participated from the very beginning in the work of UNCLOS-III and was an active protagonist in the debates of the straits' question. The book offers a first hand testimony of the straits' negotiation, which will be extremely useful for scholars and students of the Law of the Sea.

Airframe and Powerplant Mechanics Powerplant Handbook

In the pantheon of air power spokesmen, Giulio Douhet holds center stage. His writings, more often cited than perhaps actually read, appear as excerpts and aphorisms in the writings of numerous other air power spokesmen, advocates-and critics. Though a highly controversial figure, the very controversy that surrounds him offers to us a testimonial of the value and depth of his work, and the need for airmen today to become familiar with his thought. The progressive development of air power to the point where, today, it is more correct to refer to aerospace power has not outdated the notions of Douhet in the slightest. In fact, in many ways, the kinds of technological capabilities that we enjoy as a global air power provider attest to the breadth of his vision. Douhet, together with Hugh “Boom” Trenchard of Great Britain and William “Billy” Mitchell of the United States, is justly recognized as one of the three great spokesmen of the early air power era. This reprint is offered in the spirit of continuing the dialogue that Douhet himself so perceptively began with the first edition of this book, published in 1921. Readers may well find much that they disagree with in this book, but also much that is of enduring value. The vital necessity of Douhet’s central vision-that command of the air is all important in modern warfare-has been proven throughout the history of wars in this century, from the fighting over the Somme to the air war over Kuwait and Iraq.
